## 108064535 陳文遠

### • OBJECTIVE

Compare the throughput of

- Pure ALOHA
- Slotted ALOHA
- CSMA(unslotted 1-persistent, slotted 1-persistent unslotted non-persistent, slotted non-persistent)

#### • OUTPUT RESULT

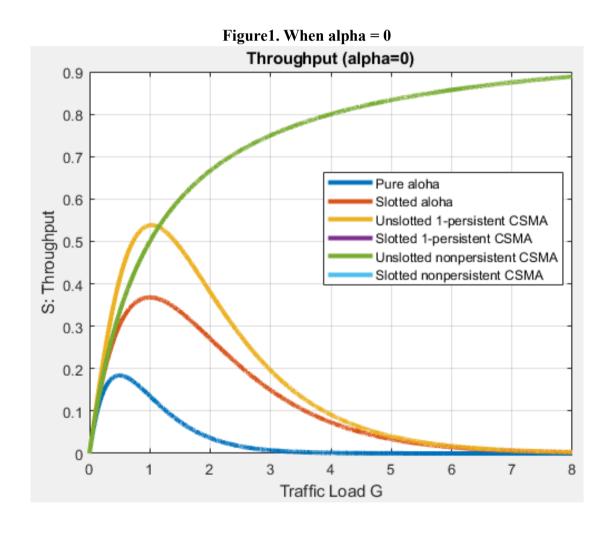

Figure 2. When alpha = 0.01

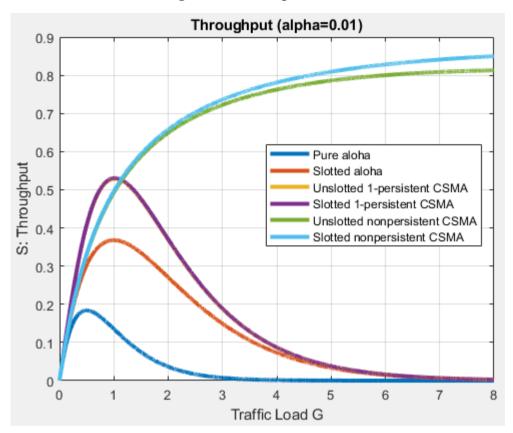

Figure 3. When alpha = 0.1

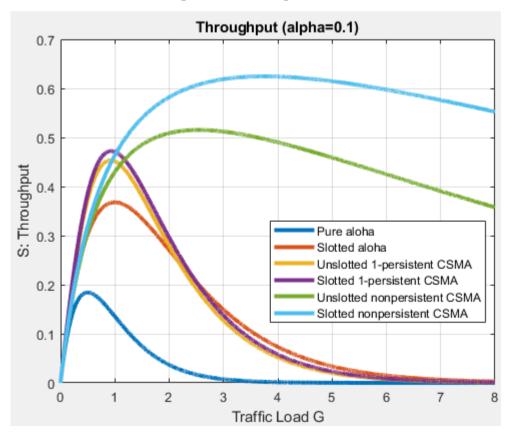

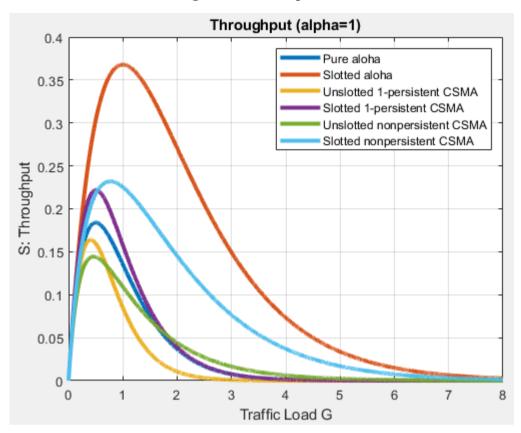

Figure 4. When alpha = 1

### • COMPARE THE PERFORMANCE

首先·由於 Pure ALOHA 在遇到 collision 時是選擇等待一段隨機的時間後再進行重傳·而 Slotted ALOHA 則是將時間切成時槽·在過了固定個 slot 的時間後進行重傳·因此可以有比較 高的利用率·所以 Slotted method 的 Throughput 都會比 Unslotted method 高。比較特別的是·當 alpha = 0 時·會令 Slotted 1-persistent CSMA 和 Slotted non-persistent CSMA 的分母為 0·所以這兩者在 alpha = 0 時並不存在。
